APPLICATION

This paper investigates the use of the Fuzzy AHP-TOPSIS method to the problem of human resource selection. Results are reported on the application of this hybrid method to the case of manager selection process in a prominent telecommunication company in Indonesia which has a robust human resource management process, including for assigning its employees to different roles in the company. However, our experiments results seem to indicate that although there is a set of commonly known values in the company, the process of manager selection might not strictly adhere to these values. Emphasis on the evaluation aspects shows some variation in different regions, indicating that local values might also influence the selection process.

CONCLUSION

Strategic human resource management aims at integrating human resource management in organizational strategy. The article analyzes some of the approaches as described in current literature on strategic human resource management. It is concluded that human resource managers are still confronted with problems in linking human resource management and corporate strategy. To overcome some of these problems for human resource managers an alternative concept of strategy is introduced. Possibilities for strategic human resource management and implications for the human resource manager, in using this alternative concept are sketched out.

SCOPE

We first developed theory arguing that HR managers' and other middle managers' involvement during strategy making would have different effects on performance for firms pursuing different business-level strategies. Then, our empirical study tested the hypotheses in the context of HR managers and middle managers in the Hong Kong Special Administrative Region, People's Republic of China. We found that HR manager involvement during strategy making was positively related to perceptions of future business performance. The use of a differentiation strategy was also positively associated with future performance. Neither the use of a cost leadership strategy, however, nor involvement by other middle-level managers, was directly related to perceived future performance. Interestingly, pursuit of a cost leadership strategy, combined with either high HR manager involvement or high middle manager involvement, produced high business performance. Thus, we found a positive and significant interaction such that increasing levels of manager involvement in strategy and a cost leadership strategy was associated with much higher levels of performance.
